CalSim–CoSANA Integration for Sacramento Regional Water Bank (SRWB) Modeling

CWEMF 2024 September 24, 2024 Presenters: Stantec – Dr. Puneet Khatavkar Woodard & Curran – Jingnan Zhou

Agenda

- Water Bank Analysis Framework (Puneet)
- Modeling Overview & Demand and Supply Assumptions (Puneet/Jingnan)
- CalSim-CoSANA Updates (Puneet/Jingnan)
- Groundwater Impacts and Metrics for Analysis (Puneet/Jingnan)

Sacramento Regional Water Bank Project Team

- Regional Water Authority (RWA)
 - Trevor Joseph, P.G., C.Hg.
 - Raiyna Villaseñor
- Khadam Consulting
 - Ibrahim Khadam, Ph.D., P.E., PMP
- Stantec
 - Puneet Khatavkar, Ph.D., P.E., ENV SP
 - Andy Draper, Ph.D., P.E.
 - Tom Fitzhugh
 - Vanessa Nishikawa
 - Rafael Herrera
- Woodard & Curran
 - Ali Taghavi, Ph.D., P.E.
 - Reza Namvar, Ph.D., P.E.
 - Jingnan Zhou

Water Bank Analysis Framework

The Big Story - The Water Bank is an Expansion of Conjunctive Use Operations

Conjunctive Use

Water use is shifted to more surface water in wet conditions. Water use is shifted to more groundwater in dry conditions.

Water Banking

Expansion of conjunctive use relying on market-based tools to provide additional water reliability and environmental benefits.

Modeling Overview & Demand and Supply Assumptions

CalSim 3 and CoSANA Key Modeling Assumptions

ltem	CalSim 3 (Draft LTO 2024 Model)	CoSANA (GSPs Exiting Conditions with Extension to WY2023)
Simulation period	• 100-year (Oct 1921- Sep 2021)	• 54-year (WY 1970 – 2023)
Climate and Hydrology	 Historical adjusted hydrology, existing upstream flow regulations, and current sea levels reflecting sea level rise. 	• 54-year Hydrology (Same as WY 1970 – 2023)
Land use	• Average irrigated crop area for 10-year period 2004-2013.	2015 Sacramento County survey
Urban Demands	 2020 UWMPs Single monthly pattern for all year types based on production data from DWR's PWSS database or UWMP data when available 	• Existing Urban Demands per UWMP (2015)
Urban Water Supply Mix	 2020 UWMPsStakeholder inputs for American River Basin	• 2015 UWMP
Agricultural Demands	 Land use based. Developed using CalSimHydro (with built-in IWFM Demand Calculator) 	• Estimated by Model based on current crop mix and irrigation practices and historical hydrology
Agricultural Supply Mix	Agricultural Water Management Plans	Agricultural Water Management Plans

Alignment of CalSim 3 and CoSANA Modeling Assumptions

- The simulation period is set to 50-year period from Oct 1969 to September 2021 to reflect the period of overlap between the simulation periods for the two models.
- Urban demand units in the North and South American groundwater subbasins are mapped between both models and as appropriate, aggregated or disaggregated, to align demand and water supply representations.
- A consistent set of urban demands are used in both models, including using a single repeating monthly demand pattern for each demand unit.
- Contribution from each water supply source to meet urban demands for each demand unit is determined in CalSim 3 and then passed to CoSANA.
- Representation of agricultural demands in the Study Area are unaltered in both models.
 - The effects of agricultural demands on surface water and groundwater budgets are simulated by CoSANA and are reflected in the streamflow accretions.
 - Agricultural demands are calculated using similar methodology for both models, with some differences in land use and crop information assumptions.
 - $\circ~$ Because the focus of the Project is on M&I conjunctive use.

CalSim-CoSANA Updates

CalSim 3 Updates - Summary

- Baseline model based on LTO 2024 Draft CalSim 3 model
- Demands updated for American River basin
- Minimum and maximum groundwater pumping limits implemented to make model consistent with CoSANA and GSP assumptions and based inputs from Stakeholders
- Demand units in American River Basin disaggregated to match the CoSANA demand units
- Replaced C2VSim based GW DLL terms for seepage, SW runoff, and return flows to use CoSANA net accretions in Consumnes, American and Mokelumne River basins (CoSANA model domain).

Refinements to CalSim Demand Units to match CoSANA

- Demand Units disaggregation
 - Certain CalSim Demand Units were disaggregated into sub-units to allow to match the demand units in CoSANA.
- Data Disaggregation
 - Demand data was disaggregated proportional to the annual demand for each user
 - Pattern is assumed to be same as the pattern for combined demand in CalSim LTO 2024 draft model.
- Operations/Diversion Disaggregation
 - Diversions were disaggregated for each of the subunits in CalSim.
 - This included application of separate groundwater pumping limits and different water right/contract limit for each of the sub-units

Accretions Computation

Accretion_j = $Q_j - Q_i + sum(Div_{i,j})$

 Q_i = Streamflow at node I Di v_i = Diversions between nodes i and j Accretion_j = Accretion added at node j

CalSim – CoSANA Integration

- Demand and Streamflow mapping
- Refinements to CalSim Demand Units to match CoSANA demand units
- Accretions Computation
- Tools for data inputs from CoSANA to CalSim

CoSANA Overview

- Regional integrated water resources model developed as an upgrade and enhancement of the existing SacIWRM
- Built on Integrated Water Flow Model (IWFM) framework

CoSANA Overview

- Model area
 - North American, South American, and Cosumnes Groundwater Subbasins
- Layering
 - 5 layers
- Elements
 - 24,171 elements with an average element area of 37 acres
- Stream system
 - 27 simulated streams with 51 reaches
- Land Use
 - 24 land use types, including 20 agricultural crops
- Water Supply
 - Surface water, groundwater, and recycled water supply to agricultural and urban water purveyors
- Remediation Pumping
 - Groundwater extraction and cleanup at 4 remediation sites
- Hydrologic period
 - Water Years 1970-2019 on a monthly time step

What are the advantages of CoSANA over GW DLL?

- Finer resolution compared with C2VSIM (GW-DLL) provides ability to model SW-GW interactions at each stream reach in CalSim.
- Stream losses are better represented
- Capability to model recharge and recovery at well level for modeling water bank operations

American River – CoSANA Stream Nodes vs. CalSim Stream Nodes

What are the advantages of CoSANA over GW DLL?

• Finer resolution compared with C2VSim (GW-DLL) provides ability to model SW-GW interactions at each stream reach in CalSim.

C2VSim CG Model Grid

C2VSim FG Model Grid

CoSANA Model Grid

Net Accretions

Tools Developed

- 1. CoSANA postprocessor and Net accretions calculator
 - Imports stream-flows and diversions from CoSANA budget files
 - Maps CoSANA stream-flows to appropriate CalSim nodes
 - Computes net accretions for each CalSim node within CoSANA model domain

Tools Developed

- 2. CalSim-CoSANA Data transfer template
 - Imports diversions and groundwater pumping from CalSim
 - Maps CalSim diversions and GW pumping to appropriate CoSANA demand units
 - Post processes CalSim data for CoSANA and converts into CoSANA input format

CoSANA-CalSim Integration

- Developed template that takes single-page of CalSim data and disaggregates to CoSANA input files
- Templates are complete for updating supply mix

Phases of Water Bank Analysis

CoSANA -CalSim 3 Integration Initial Scenario Analysis using GSP Baseline Consistent CalSim-CoSANA Existing and Future Conditions baselines

Proposed Water Bank Alternatives

Water Bank Baselines and Scenarios

• Baselines

- Existing Conditions Baseline
- Future Conditions Baseline with Climate Change
- Cumulative Conditions Baseline with Climate Change
- Scenarios
 - Water Bank Scenario under Existing Conditions
 - Water Bank Scenario under Future Conditions
 - Water Bank Scenario under Cumulative Conditions

Groundwater Impacts and Metrics for Analysis

CalSim Results

- CalSim Results for Sacramento Water Bank Baseline Run compared with DCR 2021
- These results represent 2 iterations between CalSim and CoSANA models
- Net accretions changes were negligible after 2 iterations

Water Bank operations metrics

Water Bank Storage	Timeseries of WB storage - NASb - SASb - Project area (M&I boundaries)
Leave-behind	 Cumulative leave-behind Long-term increase in basin storage less the WB storage Hydrograph of selected wells.
Net stream seepage (potential losses)	 Change in seepage water budget component as long-term average and by year type American river Sac River Cosumnes, Bear, and Feather
Net Boundary flow (potential losses)	Change as long-term average and by year type - between NASb and SASb - Adjacent subbasins

GSPs Compliance Metrics (CoSANA)

Chronic Lowering of Groundwater Levels	Change in # of exceedance of MTs by year type. Change in # of exceedance of MOs by year type.
Reduction of Storage	Change in storage by year type - NASb - SASb - Project area (M&I boundaries)
Stream Depletions due to GW pumping	 Change in stream flows by year type and by month, exceedance charts American river Sac River Cosumnes, Bear, and Feather
Degraded GW quality	Qualitative
Land subsidence	Qualitative

- GSP Indicators:
 - NASb: >20% of wells exceed MTs for two consecutive fall measurements
 - SASb: >25% of wells exceed MTs for three consecutive years
- Adopt the approach used for the City of Sacramento EIR:
 - hydrographs showing GWL averages by WY-types
 - tabulated exceedance violations to show consistency with the GSPs

Loss Factor Analysis*

- The concept of **"loss"** refers to the physical movement of water out of the basin, which the Water Bank will analyze using scientific methods.
- Loss is determined by monitoring and accounting for water that migrates underground, potentially moving between basin boundaries, and as water that may seep into river systems, or may include reduced recharge due to recharged water.
- By doing so, the Water Bank aims to effectively account for these losses so that when banked water is later extracted, Water Bank managers will know more precisely the actual volume of water that remains and may be available for beneficial uses.

Engagement – Sacramento Regional Water Bank (sacwaterbank.com)

Leave Behind Amount for Water Bank*

- **"Leave behind"** refers to the intentional policy decision of dedicating a volume of recharged water in the aquifer to help ensure long-term sustainability.
- For example, the Water Bank plans to implement a leave-behind policy for agencies storing water with the intent of transferring it out of the basin after local needs are met. This policy mandates that a portion of the stored water remains in the basin and is never extracted as part of Water Bank operations. The primary goal of a "leave behind" is to build a reserve of groundwater that contributes to the long-term stability and resilience of the region's water supply.

Summary

- The modeling approach for Sacramento Area Water Bank is unique.
- The approach employs integrating Statewide operations model with local integrated hydrologic model and/or groundwater model.
- The modeling approach is currently used to support significant policy decisions and environmental permitting process for the Water Bank.
- This approach can be used in other similar conditions in the state, where groundwater banking opportunities are considered.
