# We are the salinity use-case team associated with COEQWAL (Just Transitions in the Delta)

*Overarching question:* What if we considered a wide range of scenarios for equitable water management in the Sacramento-San Joaquin Delta under a shifting climate of uncertainty?

- “Wicked problem”: no one solution that works for everyone
- Turn to **other forms of expertise** to identify trade-offs
- Social science collaborators conducted **interviews with diverse stakeholders** to identify **scenarios** and testing criteria of interest

# Building and testing scenarios

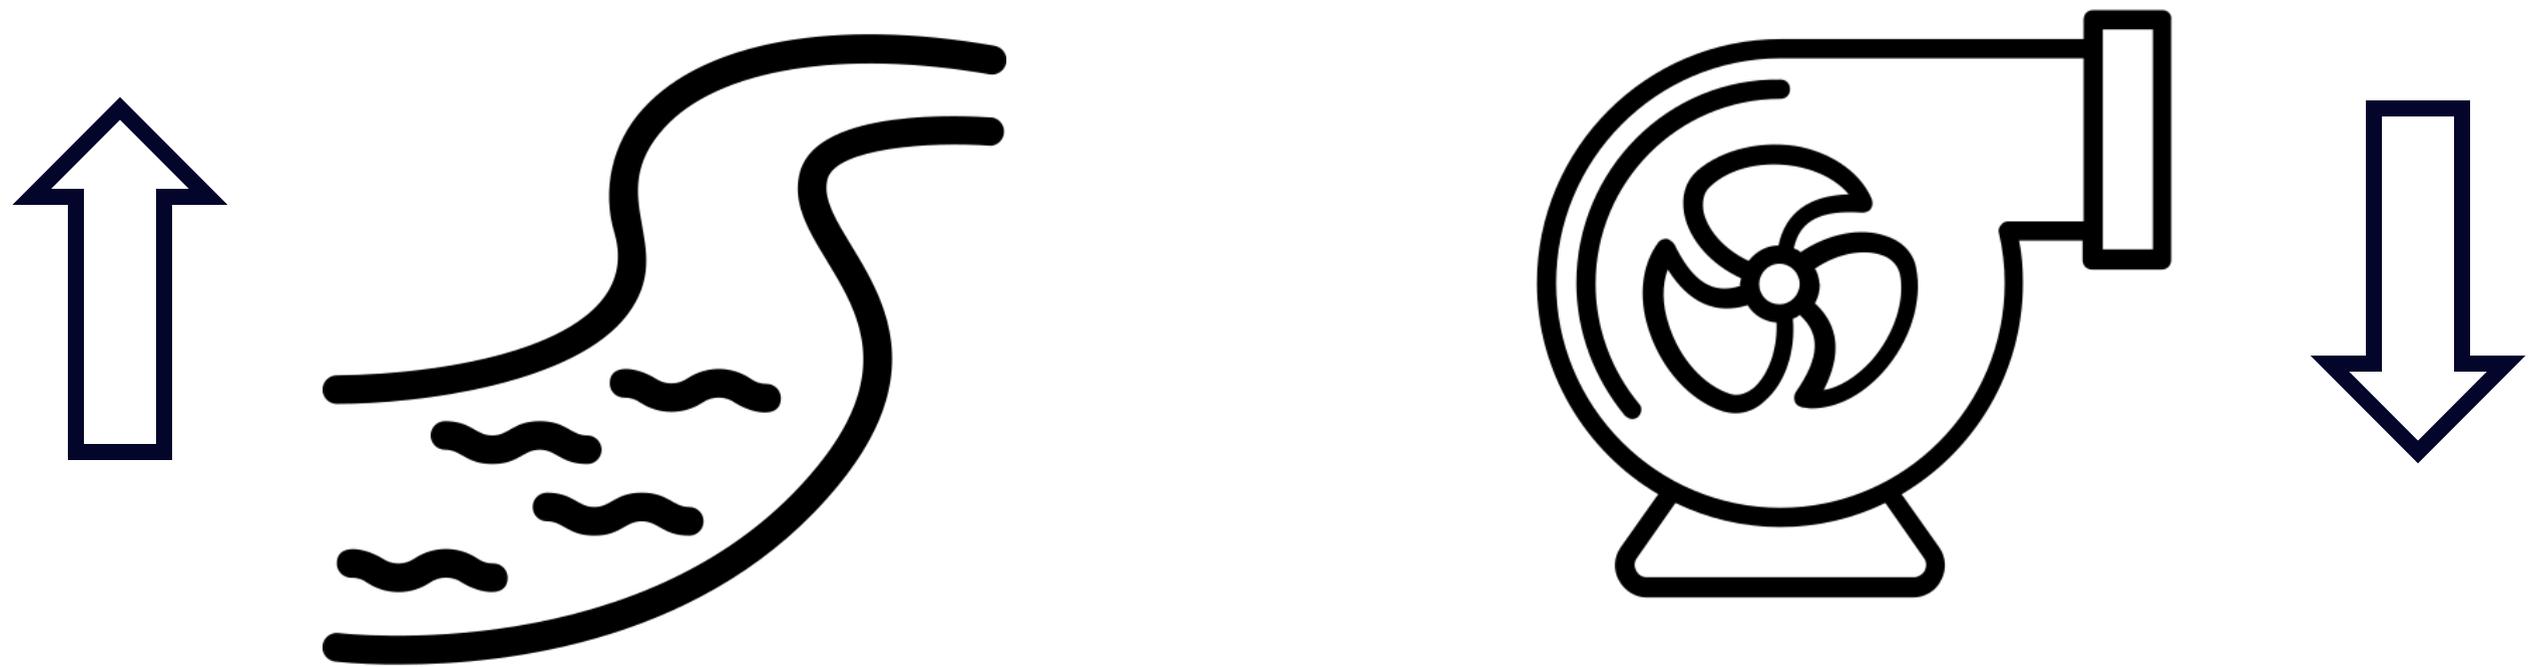

- Six scenarios in development based on interviews
- Combination of grey and green infrastructure and management changes in the Delta
- Evaluation process of scenarios focuses on “stress testing” including:
  - Drought
  - Sea level rise
  - Changes in operations
    - Changes in exports

→ Key Area of public interest and connection with COEQWAL

# We are the salinity use-case team associated with COEQWAL (Just Transitions in the Delta)

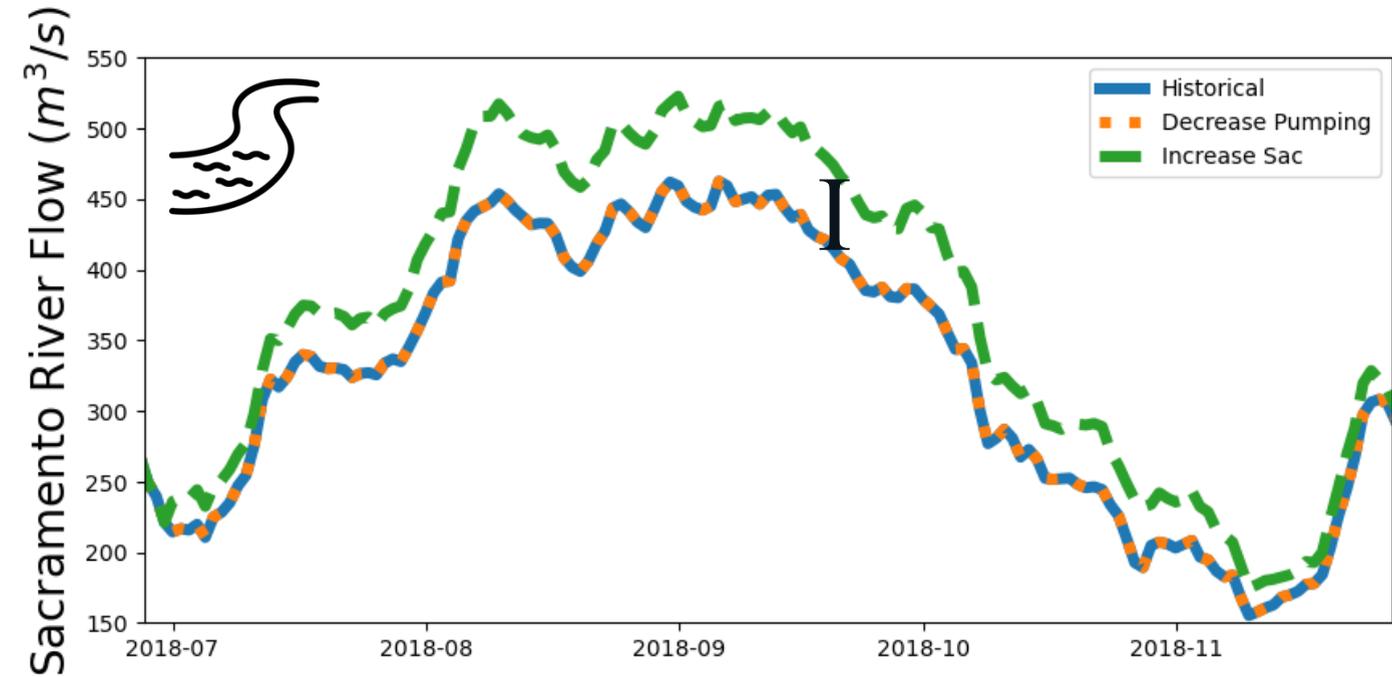

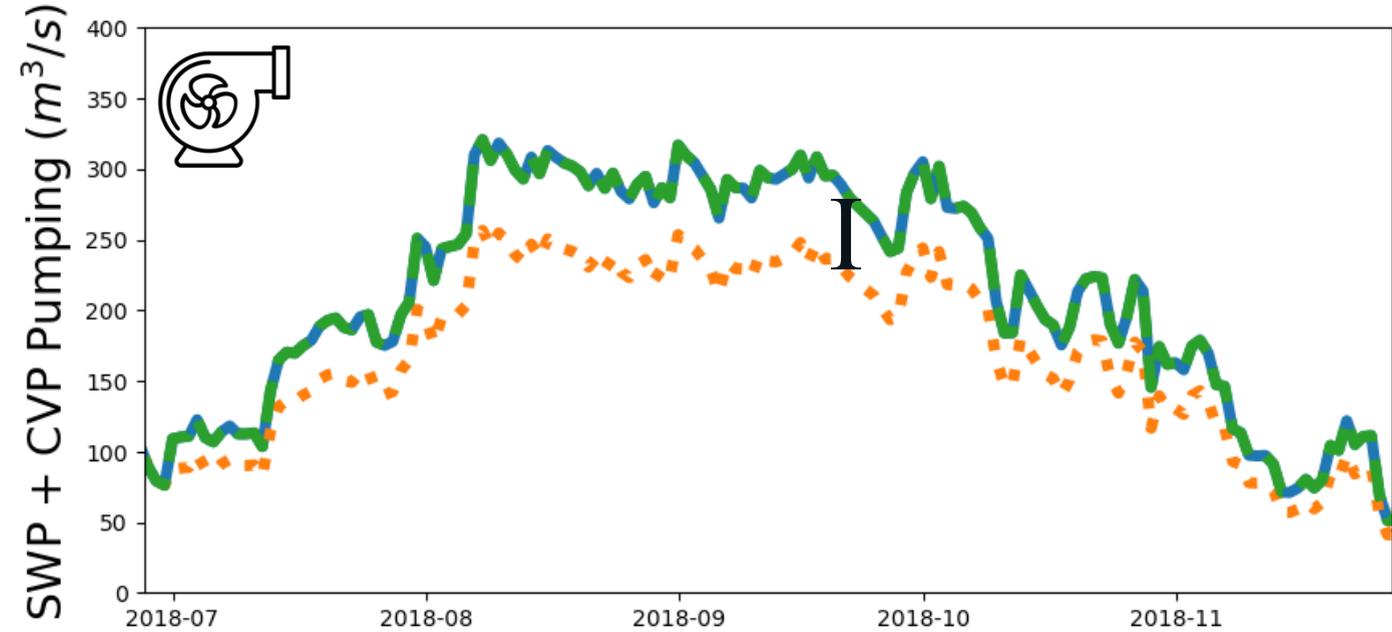

Overarching question: What if we considered a wide range of scenarios for equitable water management in the Delta under a shifting climate of uncertainty?

*Today's talk:* How does the implementation of changing net Delta outflow impact salinity in the Delta?

# Three Scenarios, Two Delta Outflows

- 1) Historical climate and operations (historical outflows)
- 2) Only difference is 20% decrease in exports from SWP and CVP
- 3) Only difference is 20% increase in inflows from Sacramento river

# Study Period: Water year 2018

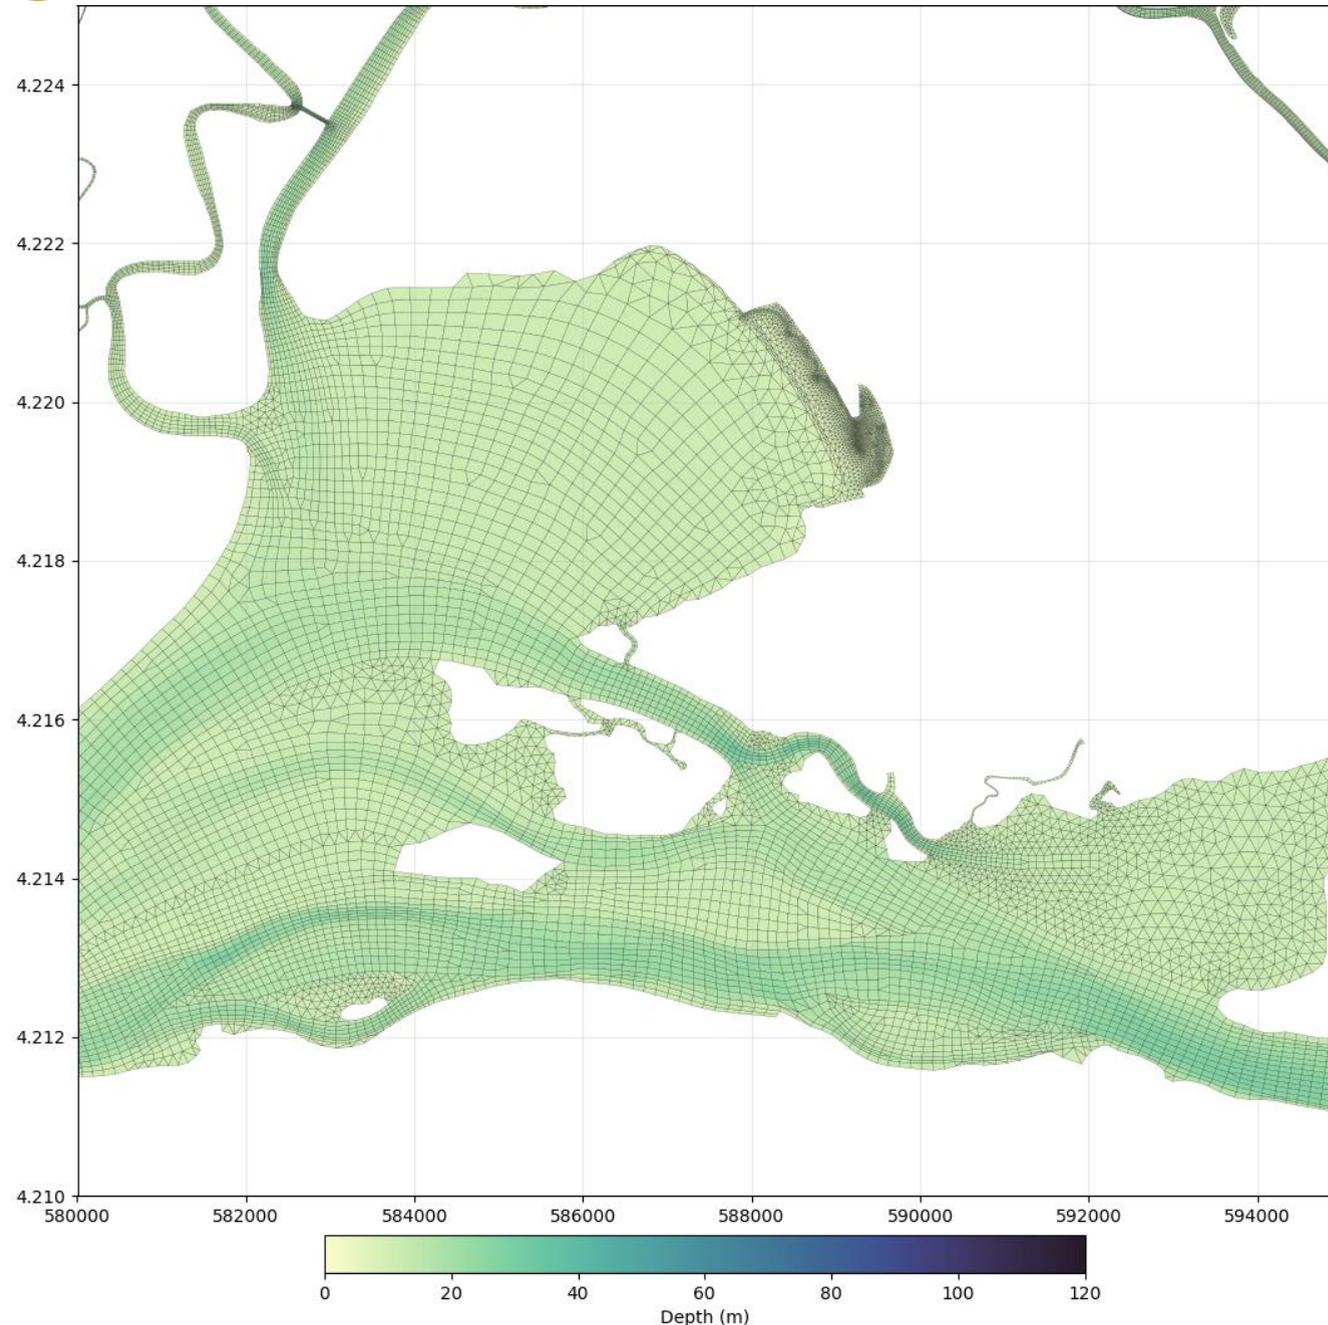

- Below normal year for San Joaquin and Sacramento Valleys after the wet year of 2017
- Changes in flows applied July 1, 2018 – December 31, 2018
- Dry enough there is a change with more flow, wet enough that health and safety levels can still be met with decreased exports\*

\* There are 5 partial days in November 2018 that go below 1500 cfs ( $\sim 42.48 \text{ m}^3/\text{s}$ )

# Hydrodynamic Modeling with SCHISM

*Semi-Implicit Cross-scale  
Hydroscience Integrated System  
Model*

- Solve equations of momentum and scalar transport in three dimensions
- Unstructured grid
- Already in use in SF Bay-Delta system by the California Department of Water Resources

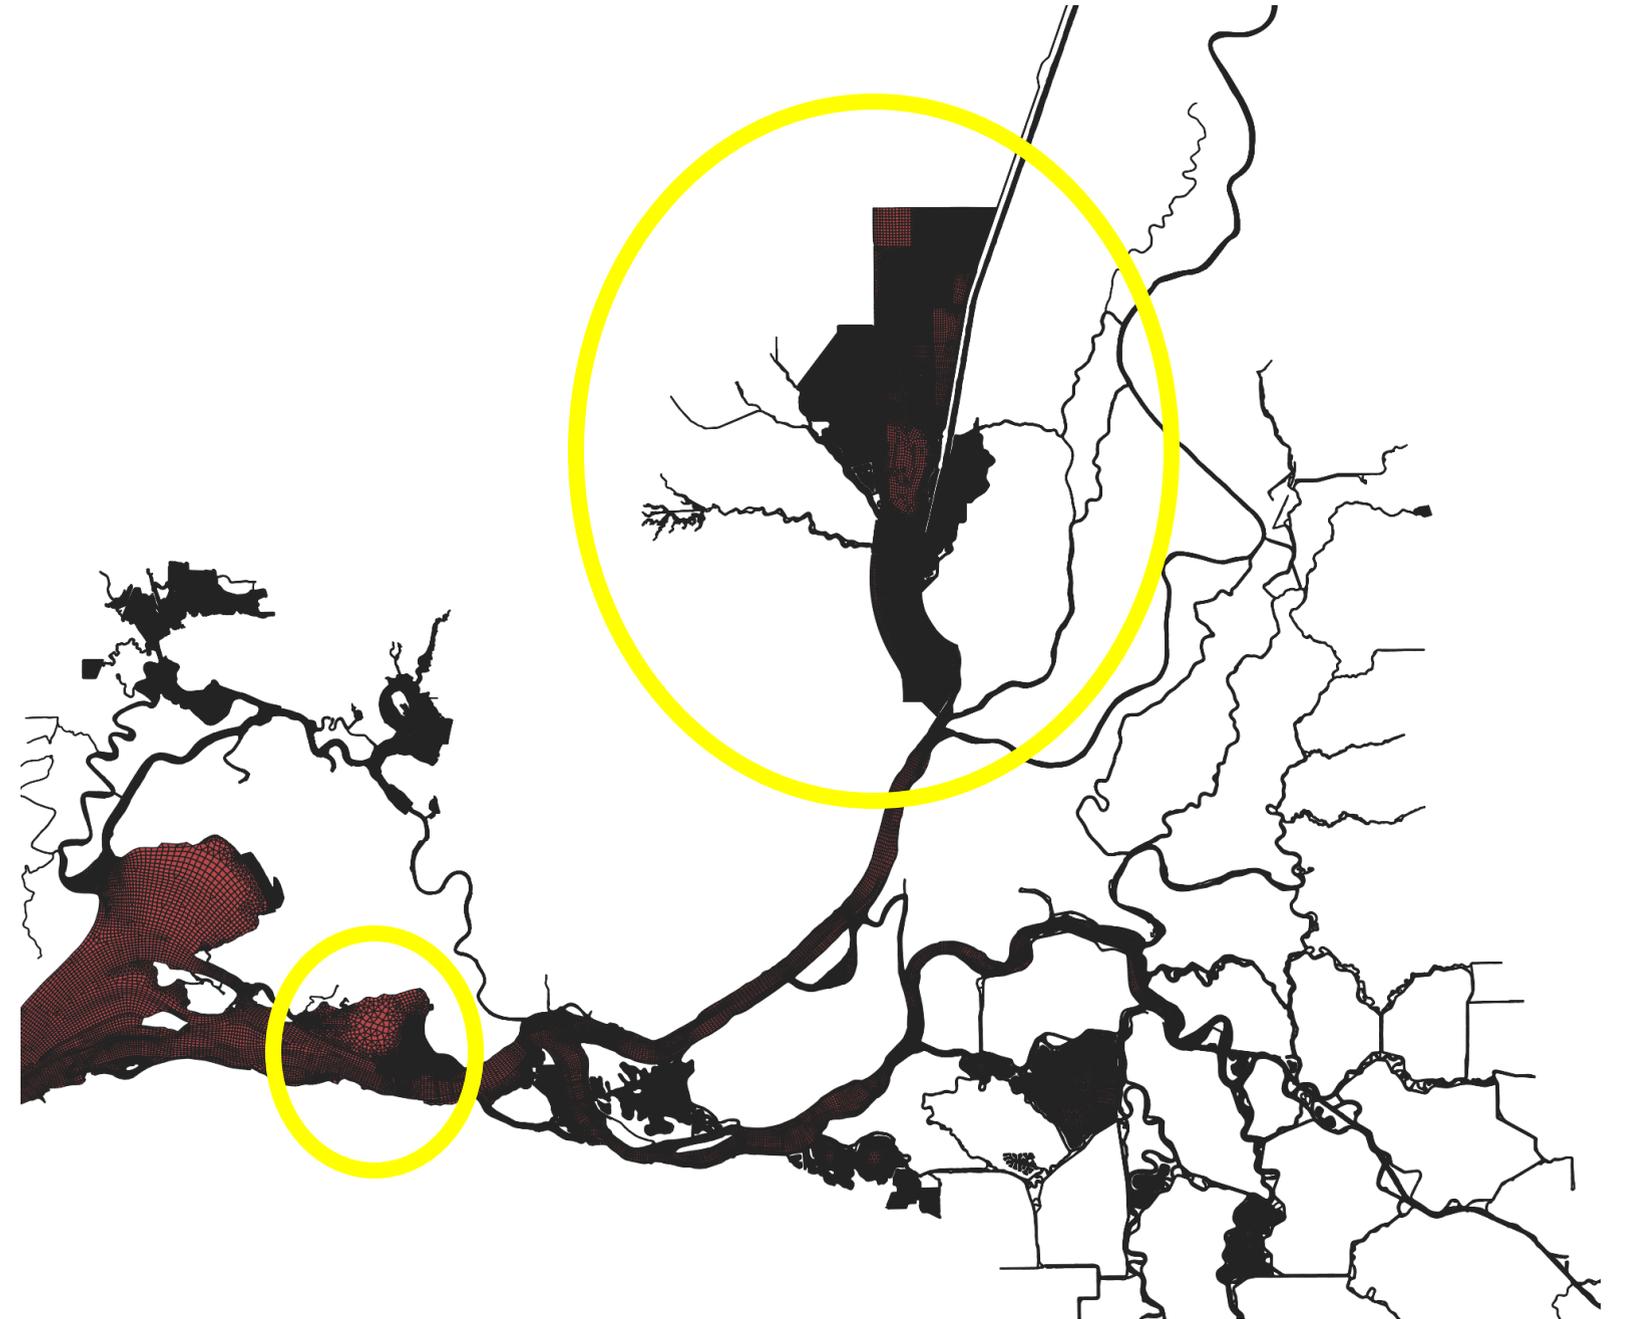

# Altered grid to include more restorations

This project is concerned with the 2050 planning horizon

- Includes existing and approved tidal wetland restorations from the Delta Plan Interagency Implementation Committee and Delta Adapts
- Most notable changes are inclusion of Chipps Island, Prospect Island, Little Egbert, and Lookout Slough

- *from DWR's restoration library*

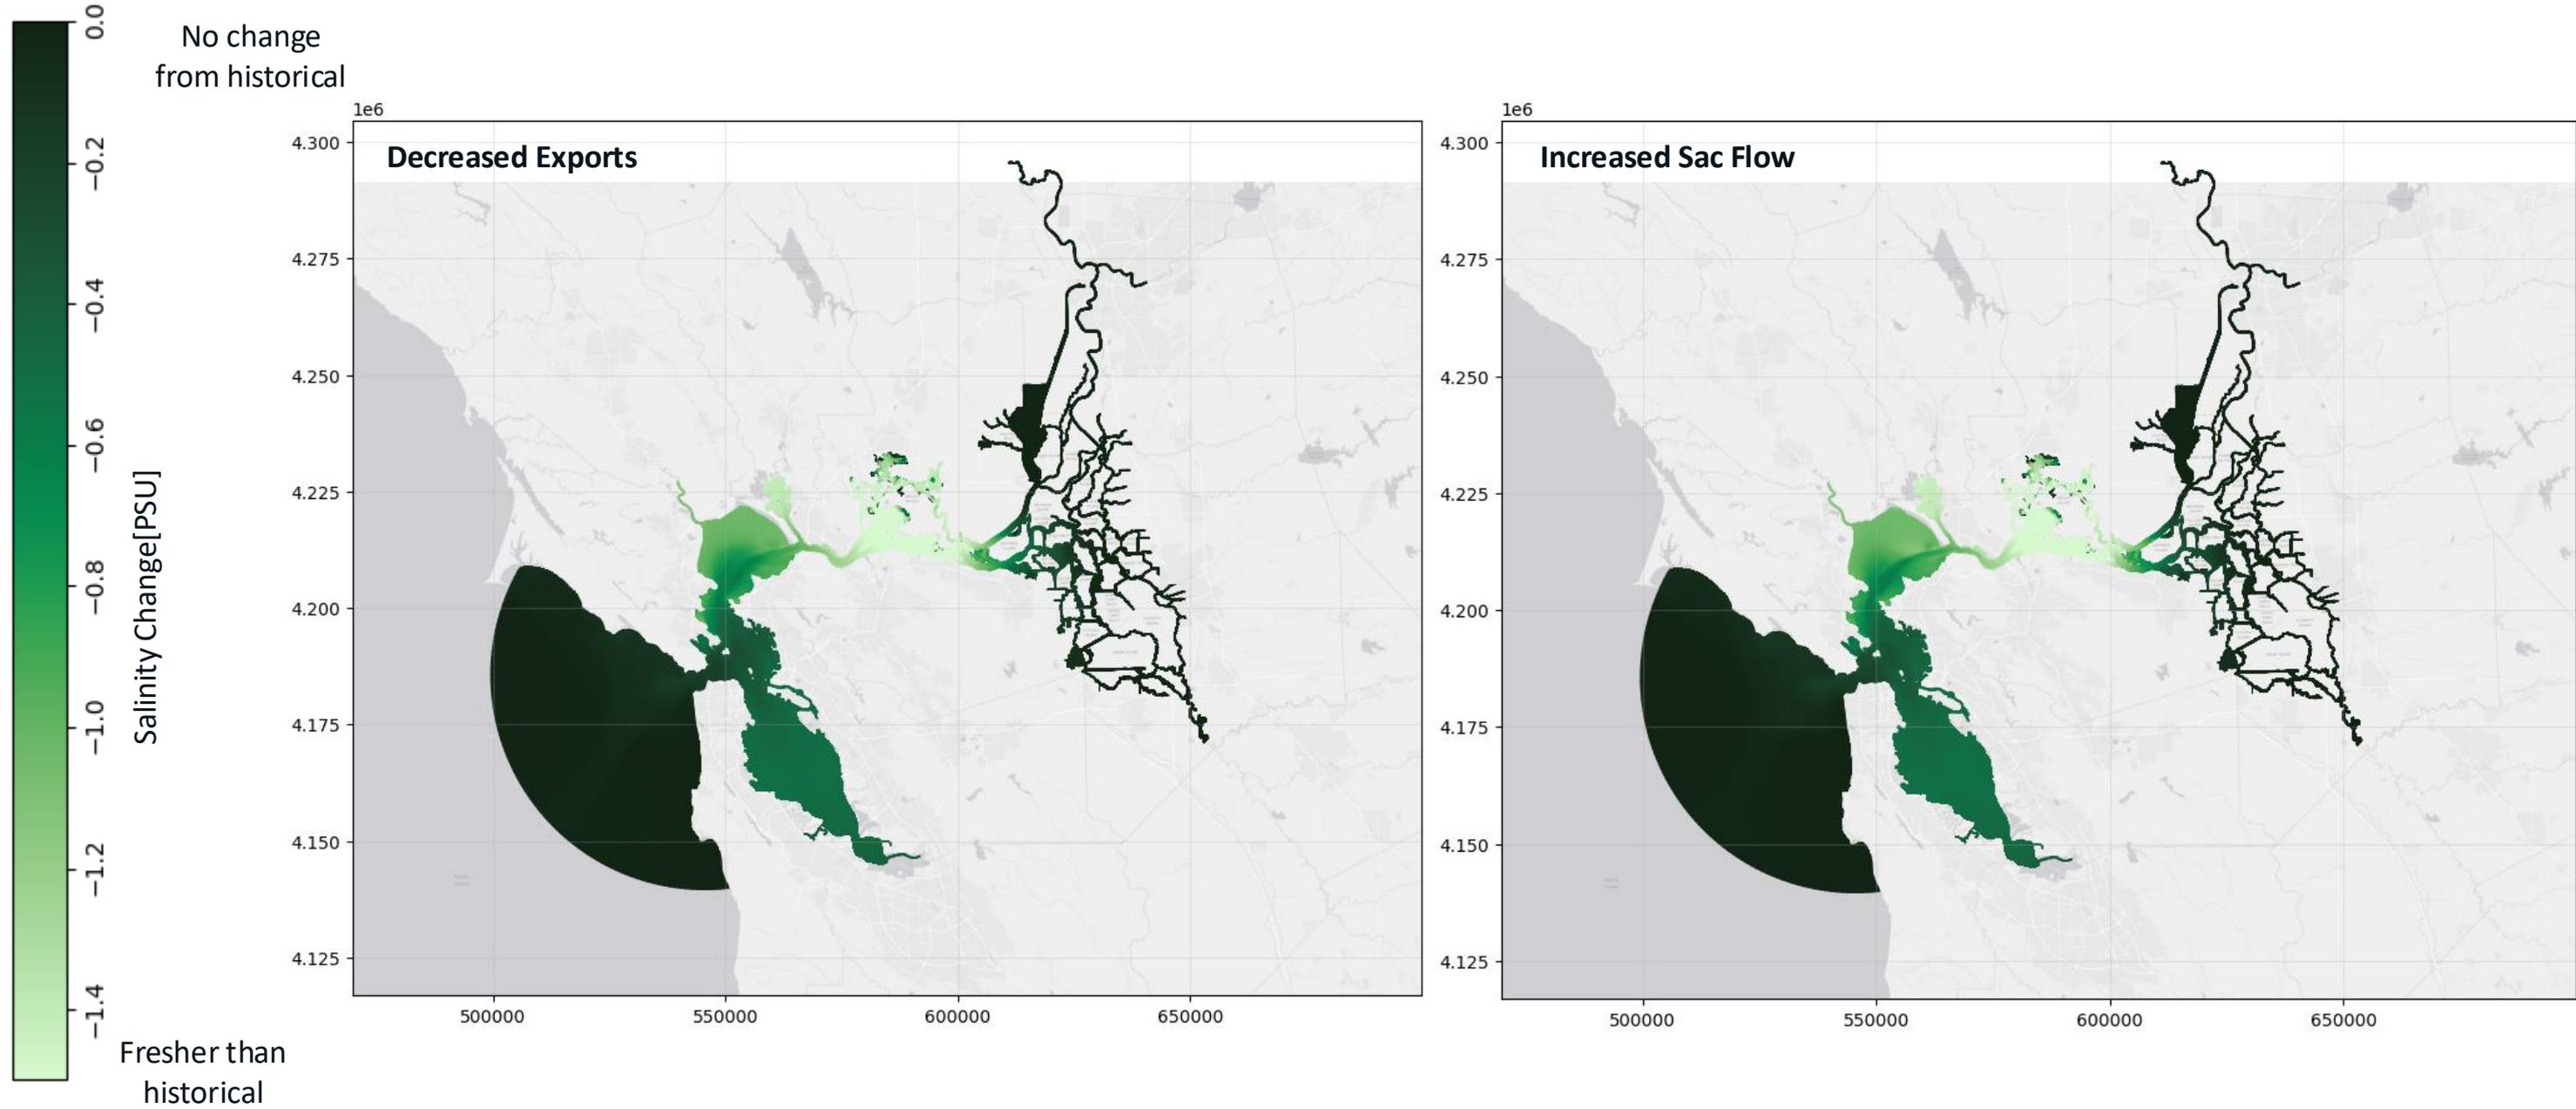

# PRELIMINARY RESULTS

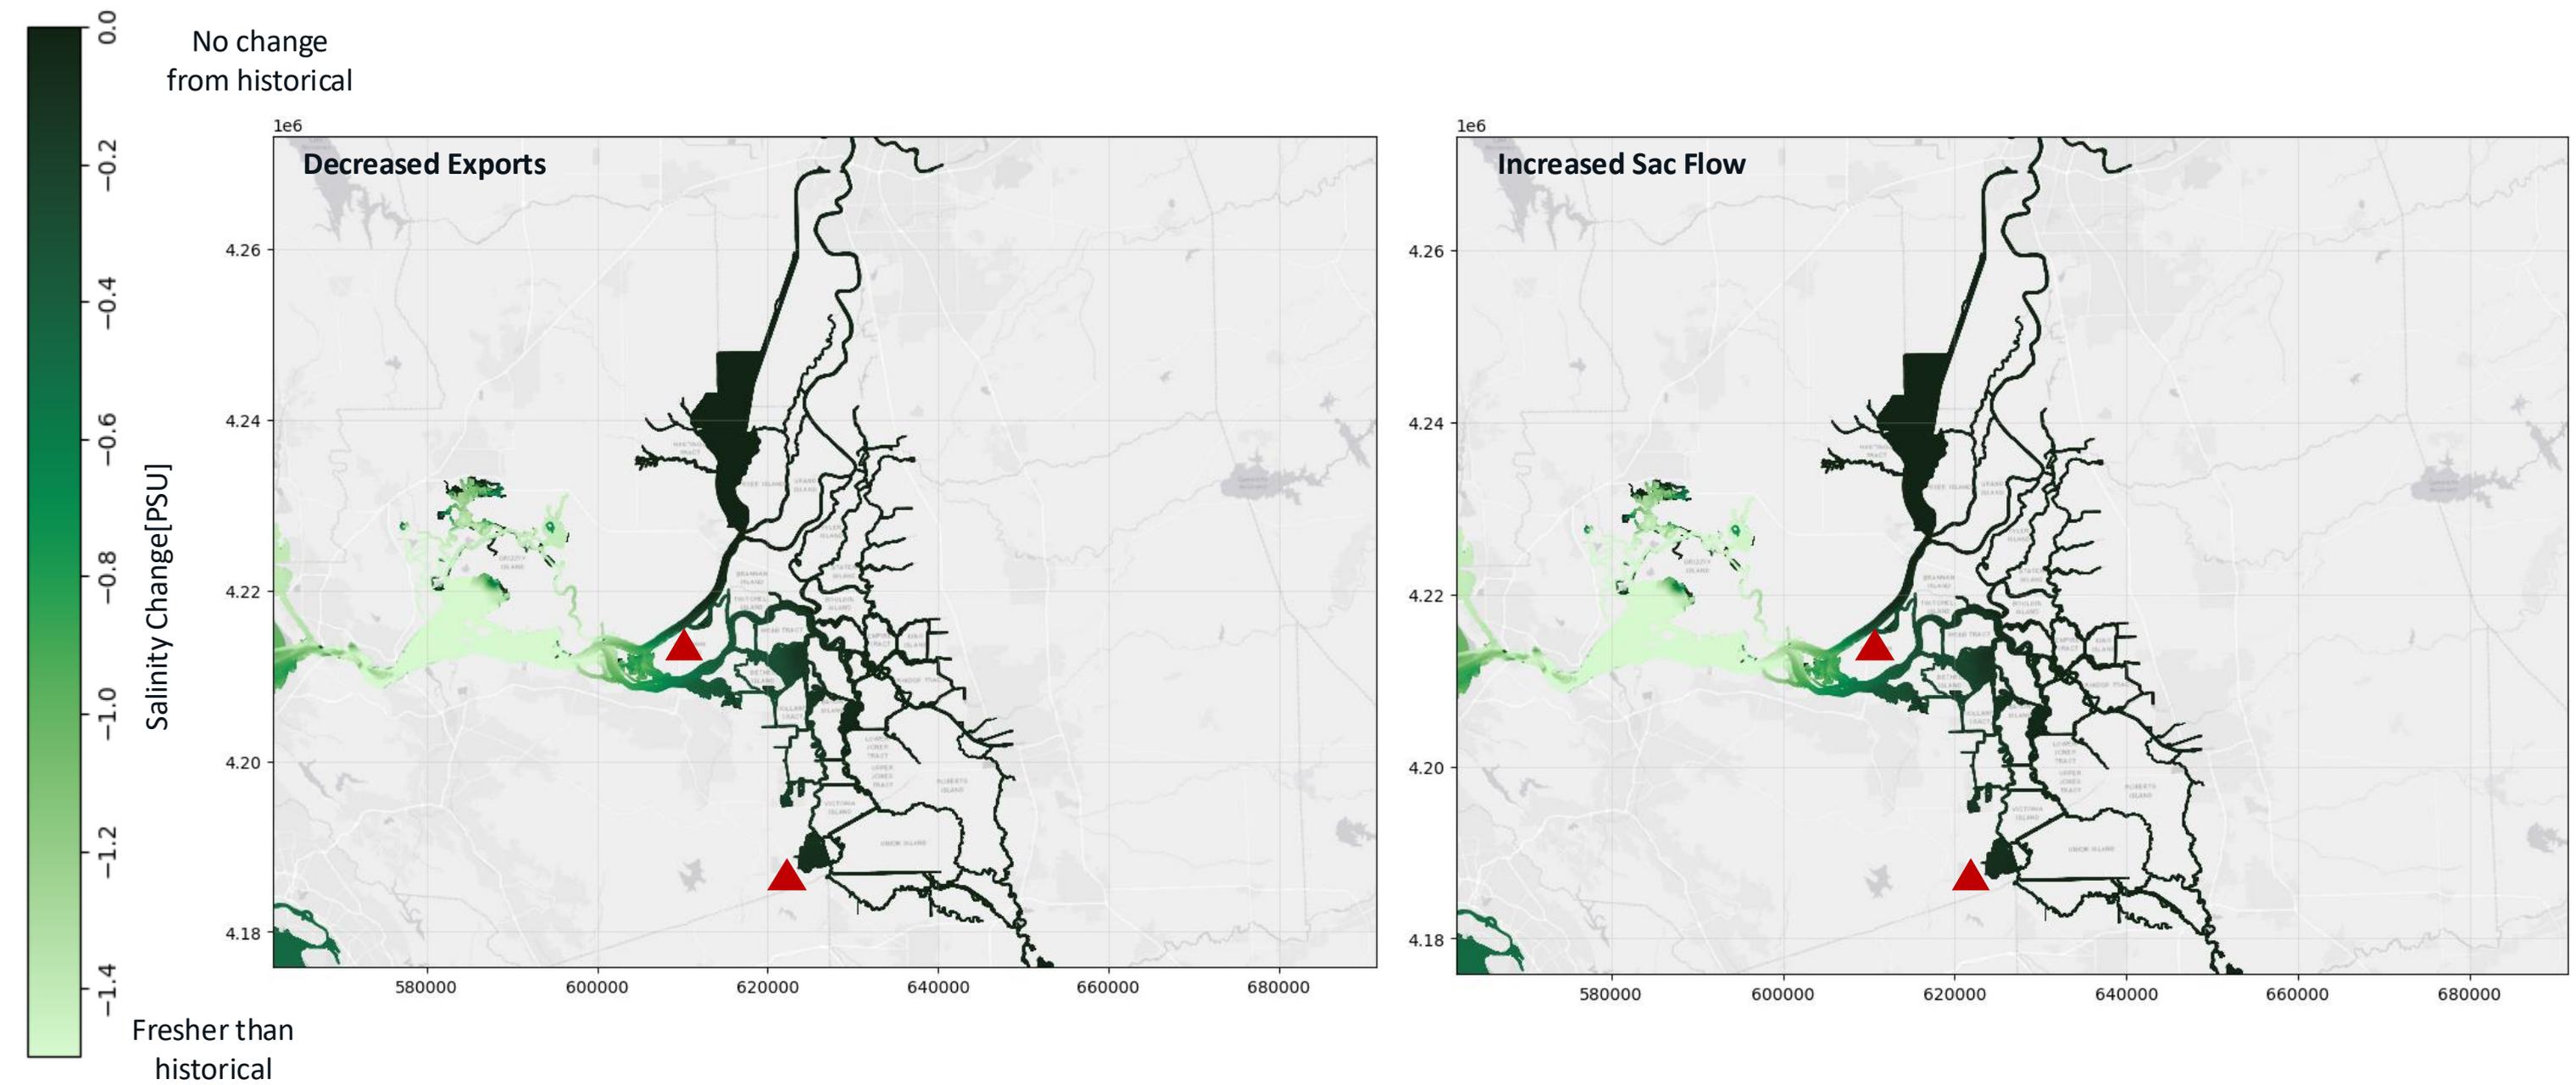

*Work in progress*

*All maps are depth averaged for the timepoint with highest salinity at Emmaton  
(November 12, 2018 16:00)*

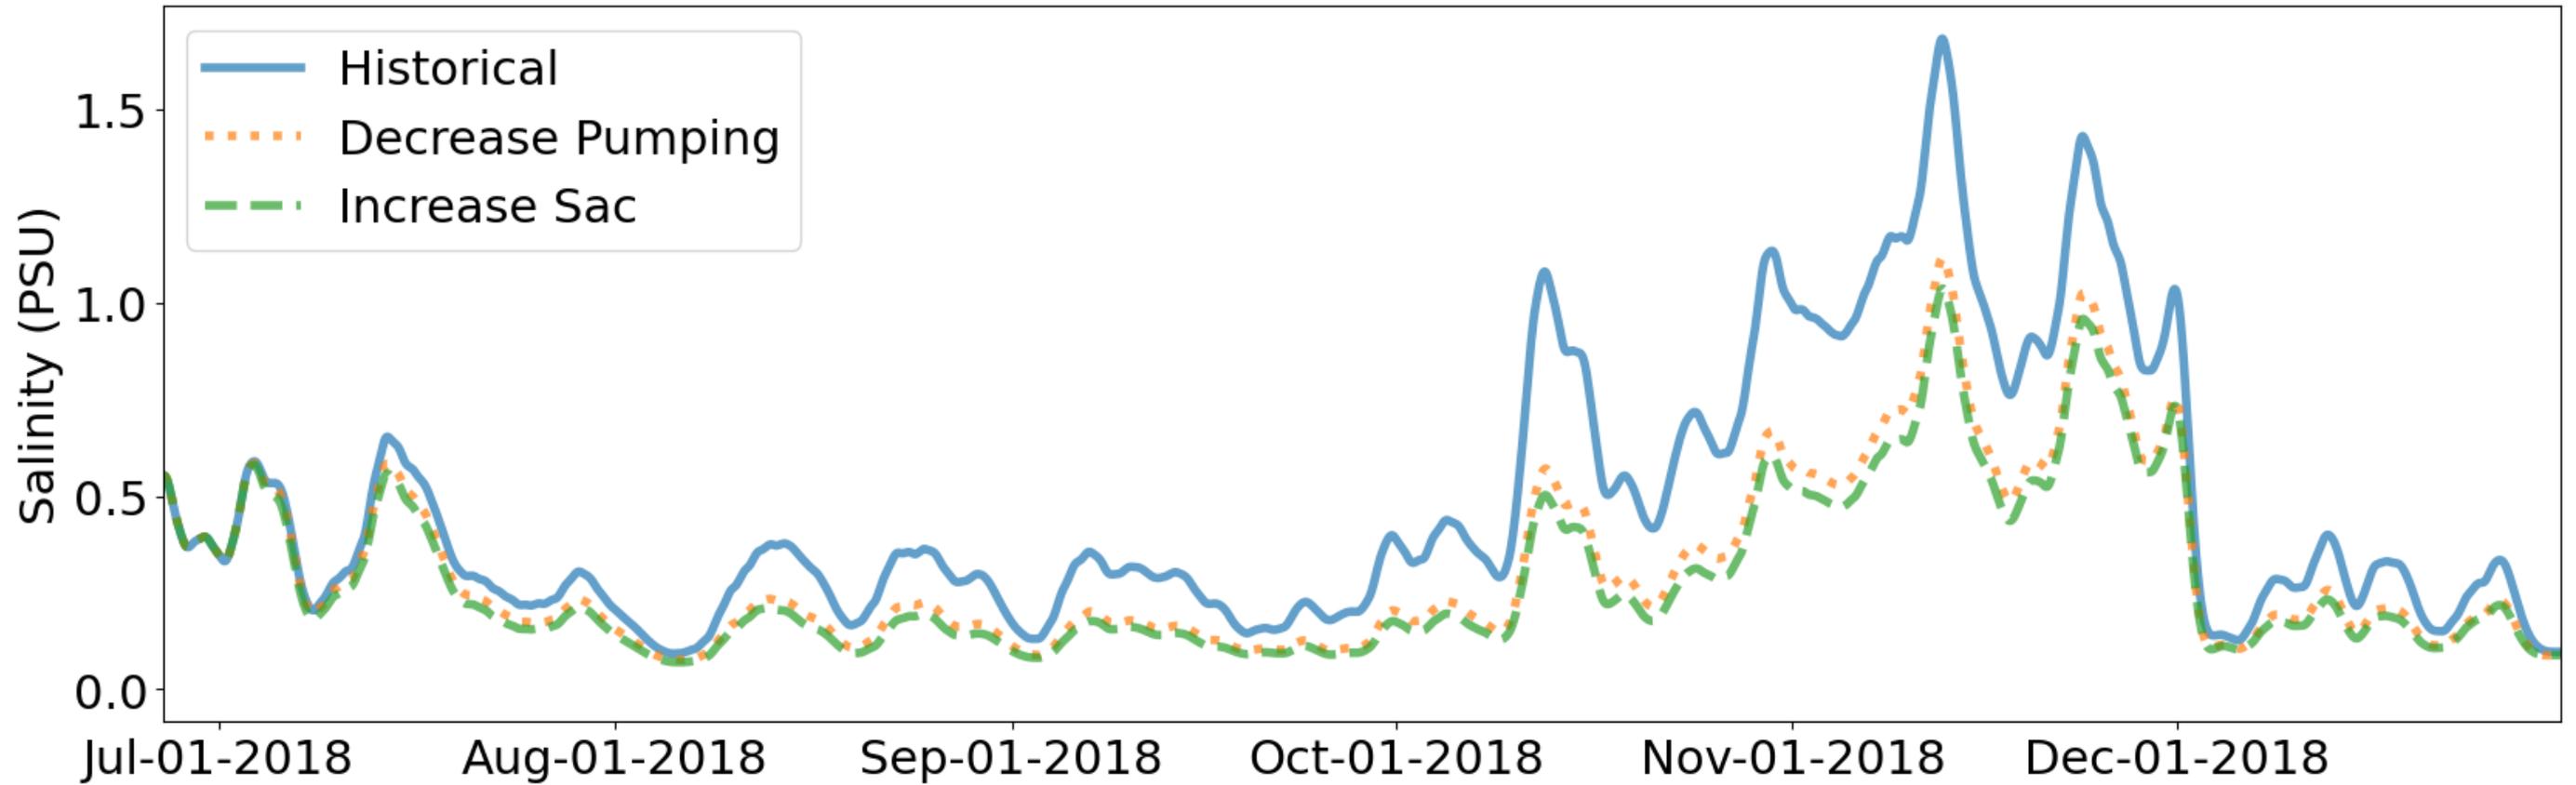

# Increasing outflow decreases salinity west of the confluence (both for changing exports and inflows, simulation day 134)

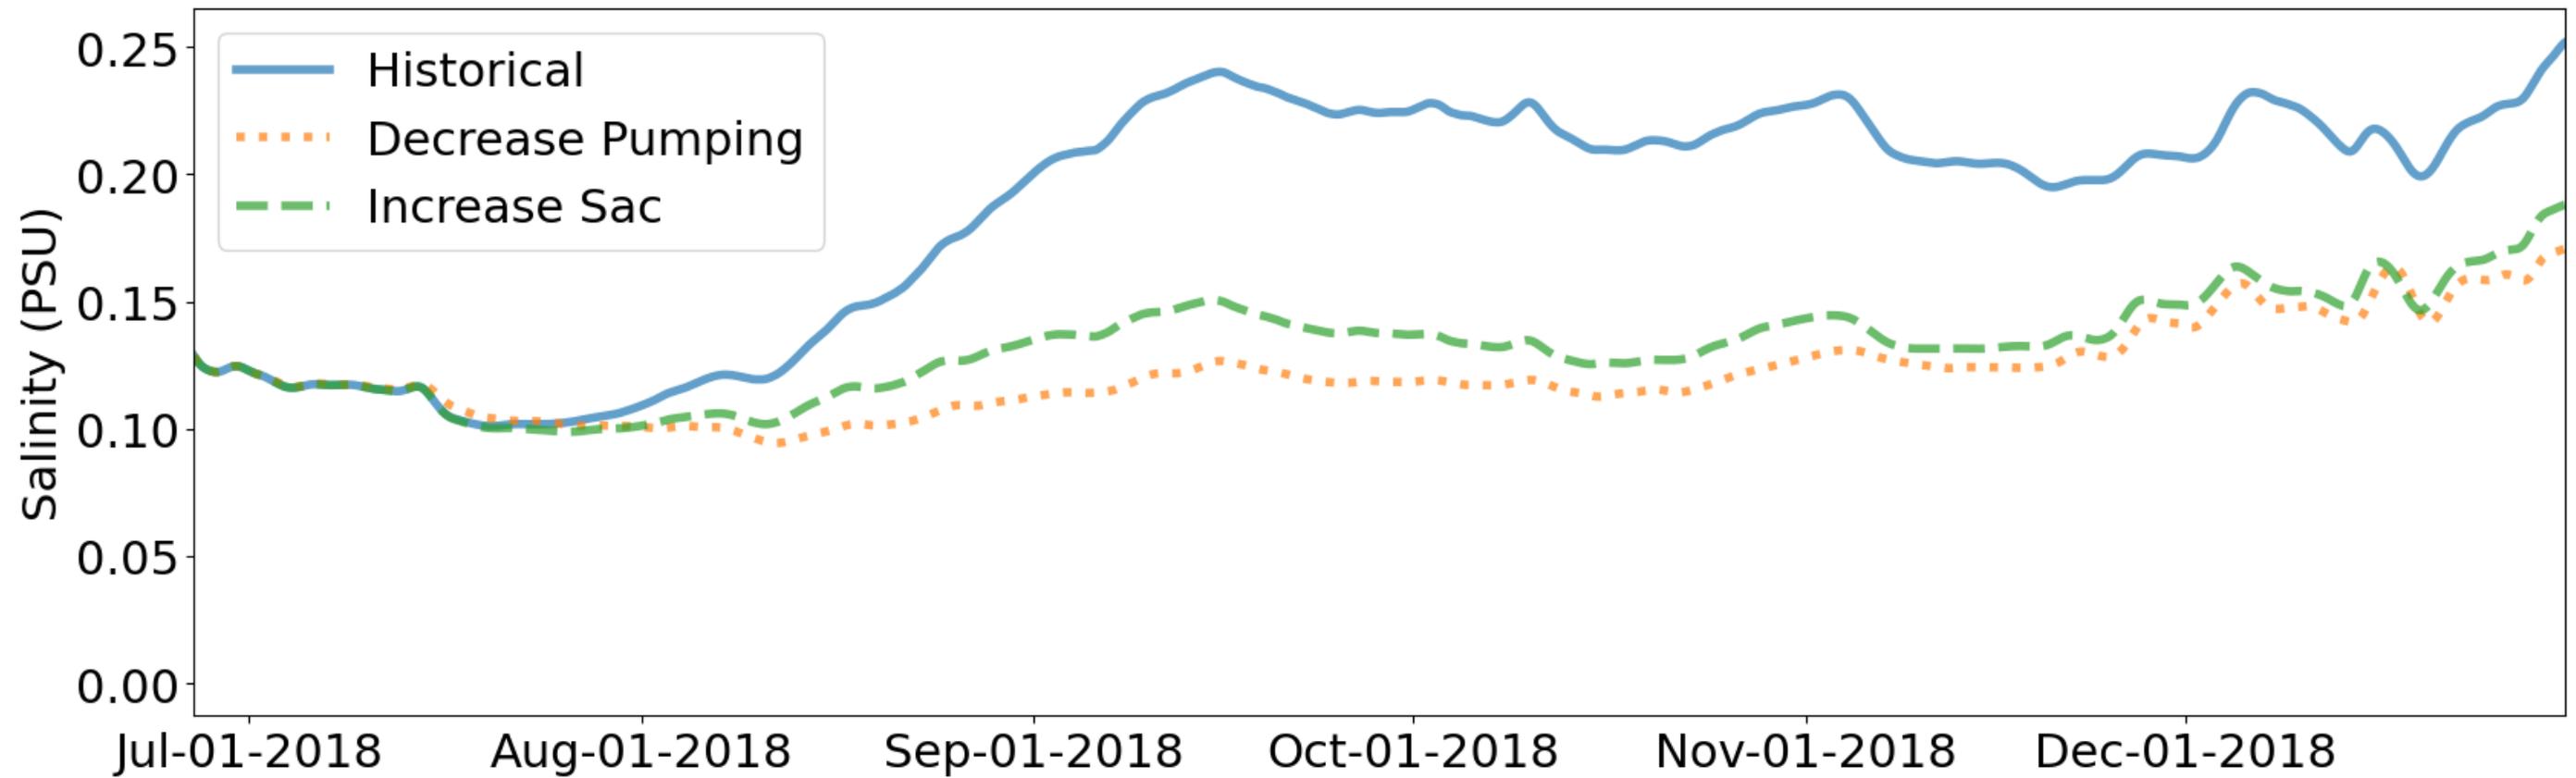

# Zooming into the Delta: Differences with between scenarios are subtle

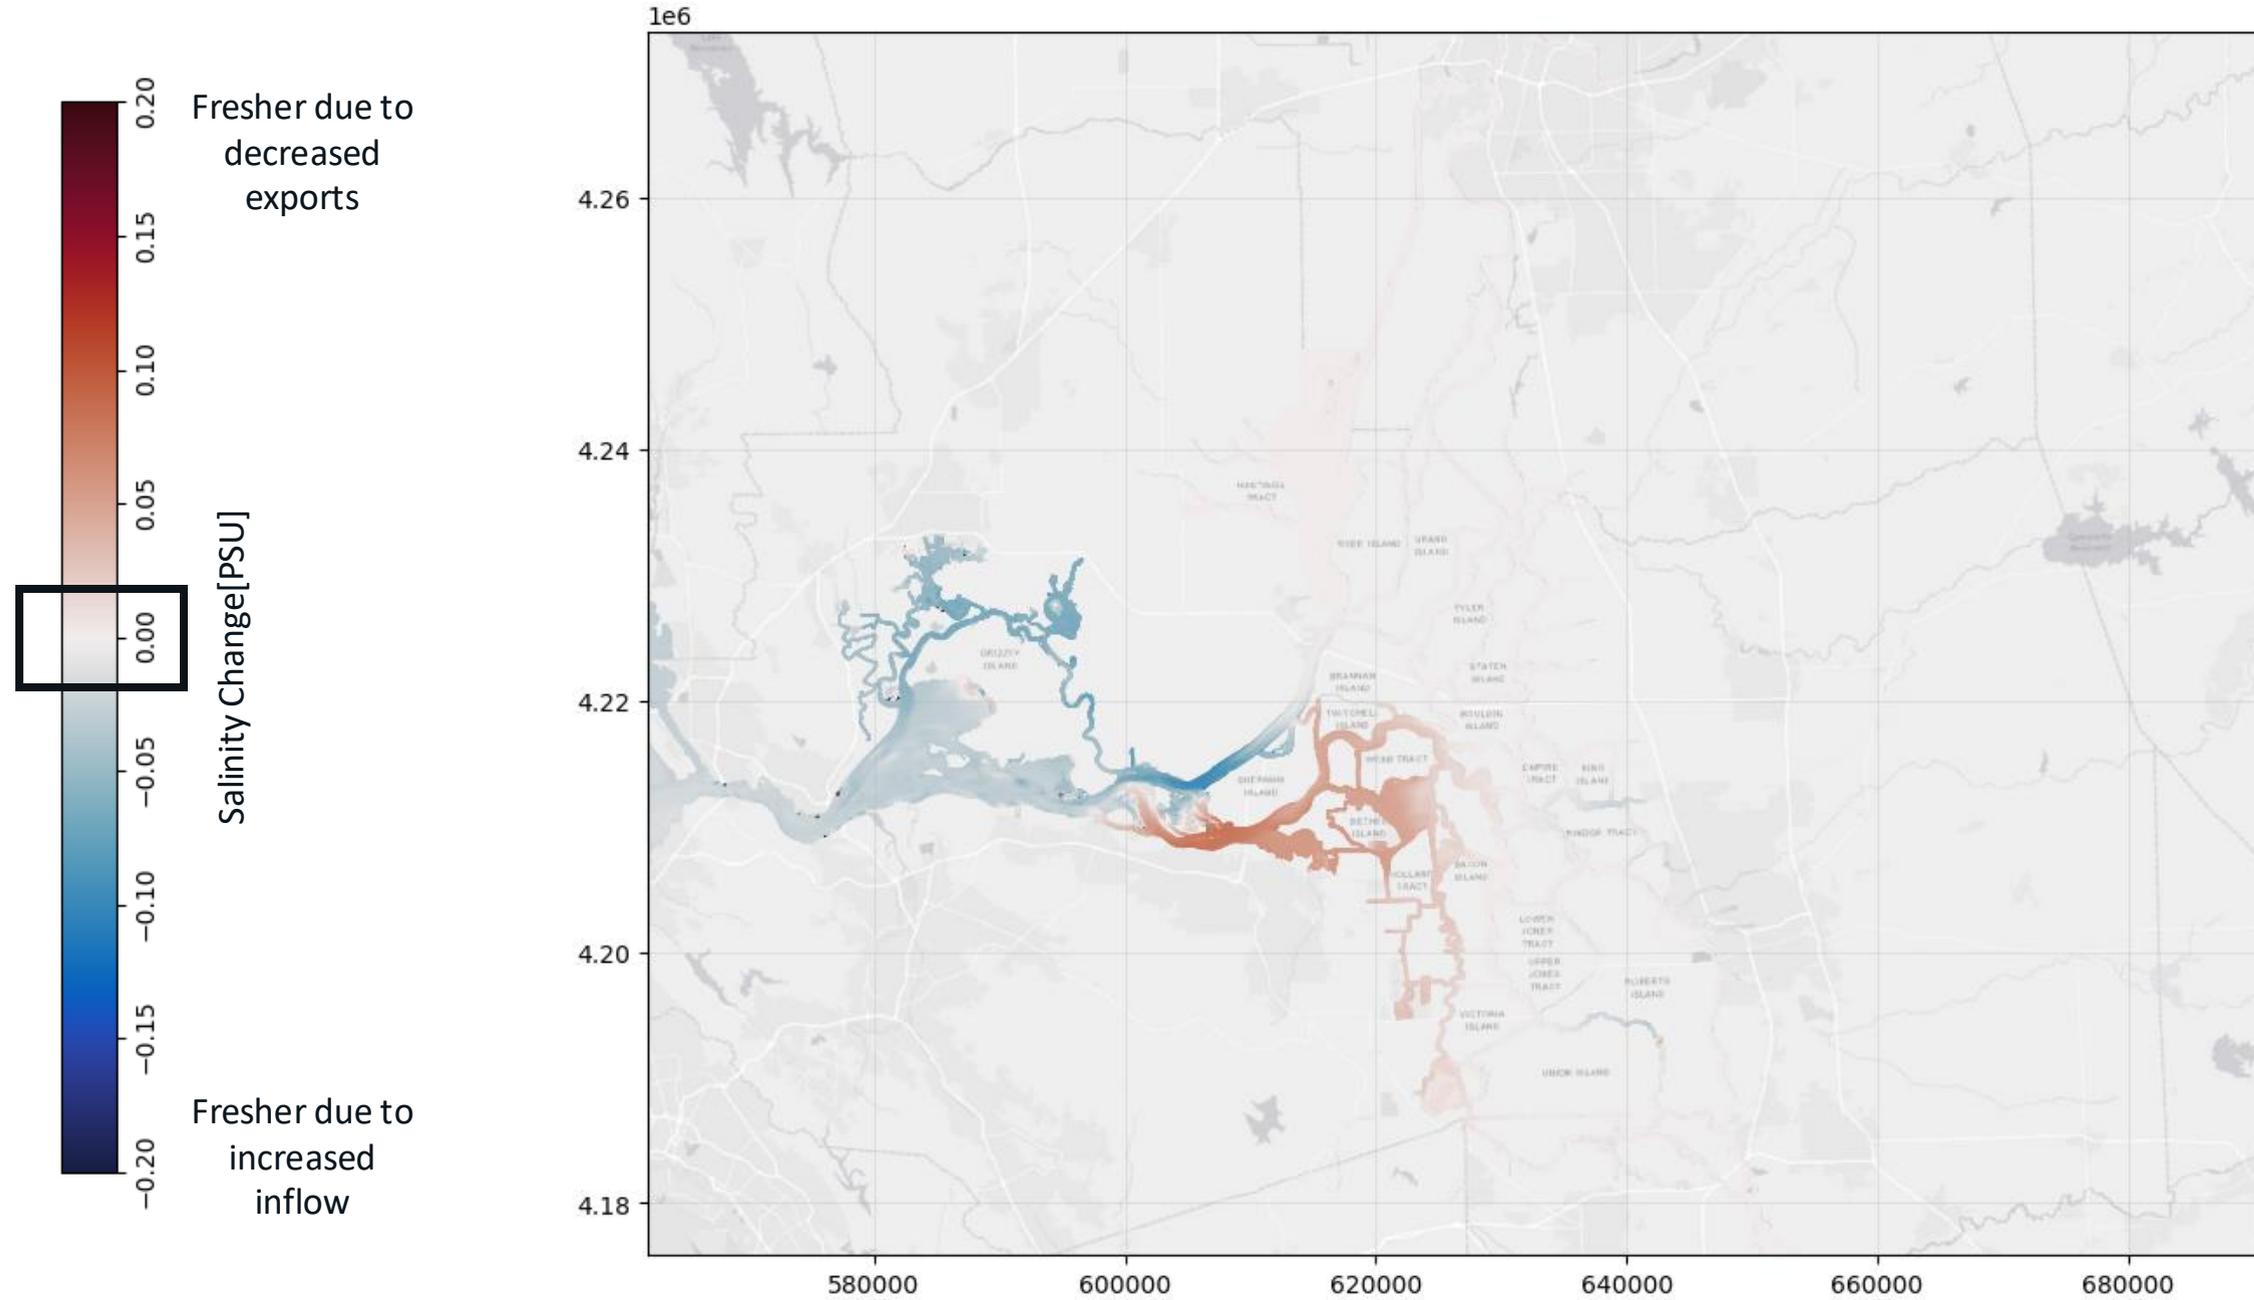

# Time Series at a Emmaton (tidally filtered)

# Time Series at Harvey O. Banks Pumping Plant (tidally filtered)

# Increased Inflows - Decreased Exports (simulation day 134)

# Future Work

- Longer study period
- What are the other hydrodynamic signatures of changing exports?
  - Tidal excursion? Flows?
- Test other levels of decreased exports and inflows
  - Are there thresholds of non-linearity?
- Are the impacts symmetrical if exports increase?
- Impact of changing exports in different scenarios
  - How do added barriers and/ or restorations impact spatial implications?
- Impacts of other operations changes
  - Reservoir operations
  - Upstream diversions
- How can we integrate this analysis with CalSim3?

# Conclusions

- Changes are subtle at first, but over time spatial differences emerge
- Decreasing exports has a greater impact in the south Delta and increasing inflows has a greater impact in the confluence
- The salinity response to changing net Delta outflow will depend on where changes in outflow occur

## JUST TRANSITIONS IN THE DELTA

JUNE  
7<sup>th</sup> & 9<sup>th</sup>

WHEN

WALNUT  
GROVE

WHERE

REGISTER

### INTERACTIVE EXHIBITION & 2ND PUBLIC WORKSHOP

Envisioning future water management scenarios under conditions of drought, salinity, and sea level rise.

SATURDAY JUNE 7<sup>th</sup> | Open Interactive Gallery 10am-4pm

MONDAY JUNE 9<sup>th</sup> | Open Gallery 9am-10am | Public Workshop 10am-4pm

Please join the Just Transitions research team at one or both of these events, where we will share how the project's future adaptation scenarios for the Delta have been further developed since our last public workshop. These scenarios are crafted through widespread public engagement that continues through these events. Both the gallery and the workshop create opportunity for public participants to provide input that will guide the research team's efforts to envision just futures for the Delta under conditions of uncertainty and accelerated change.

JEAN HARVIE COMMUNITY CENTER, WALNUT GROVE, CA  
14273 RIVER ROAD, WALNUT GROVE, CA 95690

Lunch will be provided at the public workshop on Monday
